

EnergyAustralia Network:

Annual Pricing Report

2004/05

June 2004

Energy

ENERGYAUSTRALIA NETWORK: ANNUAL PRICING REPORT, 2004-05

1. Overview

This Annual Pricing Report summarises the key elements of EnergyAustralia's 2004-05 network pricing proposal and outlines the underlying pricing goals and strategy. Specifically, it seeks to:

- outline the principles behind EnergyAustralia's Network Use of System (NUoS) pricing, comprising the Distribution Use of System (DUoS) and Transmission Use of System (TUoS) components; and
- fulfil the Independent Pricing and Regulatory Tribunal's (IPART's) requirement for supplementary pricing information in order to assess compliance with new DNSP regulatory arrangements.

For regulatory purposes, this document provides further detail regarding EnergyAustralia's final Annual Tariff Compliance Spreadsheet, which sets out EnergyAustralia's network tariff components and ensures compliance with the Weighted Average Price Cap (WAPC) form of regulatory control, network price limits and residential fixed charge limits.

The 2004-05 prices described in this document have been formulated in accordance with the directions set out in EnergyAustralia's 2002 Price and Service Report. The pricing initiatives and directions have also been outlined in submissions to IPART during the course of the 2004 regulatory review.

EnergyAustralia will be providing a separate medium-term pricing strategy in due course as part of the revised regulatory arrangements for IPART's 2004 Final Determination (the Final Determination). This will provide updated information on EnergyAustralia's medium-term pricing strategy.

2. Regulatory Arrangements

This Annual Prices Document pricing proposal is the first to be submitted in accordance with Annexure 17 of the Final Determination, based on the WAPC form of regulation.

Under the new regime, prices will be subject to a revised set of compliance criteria and the DUoS component of tariffs must comply with the WAPC form of regulatory control. The following three price constraints apply:

- the WAPC "basket" of DUoS tariffs is limited to an overall increase of (CPI + 7.0%) or 9.8%, based on audited 2002-03 consumption data;
- a price limit also applies to each NUoS tariff, except for those of large Cost Reflective Network Price (CRNP) customers. Although CRNP sites are not subject to the price limit, the relevant DUoS components of their tariffs come under the WAPC; and
- the fixed component of any domestic tariff can not increase by more than \$30 per annum.

In addition to the new form of regulation, there is a range of new reporting requirements specified in Annexure 15 of the Final Determination. Details of the new reporting requirement for an Annual Prices Document are given in Annexure 17. They are:

1. list proposed prices for network tariffs and miscellaneous charges and monopoly fees;
2. discuss the forthcoming changes in network tariffs, the prices, structure or associated criteria, and any new or obsolete Network Tariffs, and the reasons for the change;
3. explain how the prices meet the regulatory arrangements, including price limits on network tariffs, weighted average price cap control formula, and provide for the recovery of Transmission Related Payments;
4. demonstrate the impact of the forthcoming change in the Network Tariffs on typical customer's bills, including disclosing forecast average prices (based on typical bill categories);

5. confirm and demonstrate that the prices are consistent with the Pricing Principles and the information in the Network Strategy Statement;
6. outline the expected levels of service and projected capital expenditure projects that will occur for the coming Year; and
7. outline the expected consumption for major customer classes and maximum demand for the coming Year.

As this is the first year covered by the Final Determination, certain reporting requirements specified under Annexure 17 can not be met this year. In particular, Clause 5 calls for a demonstration of consistency with the Network Strategy Statement, which will be produced later in the year. For this year's submission only, EnergyAustralia's 2003 Price and Service Report and the pricing directions set out in its regulatory submissions for the 2004 Determination will be used in place of the annual Network Strategy Statement.

3. Overall Pricing Goals

In its 2004-05 pricing proposal, EnergyAustralia has continued to pursue the pricing goals detailed in the 2003 Price and Service Report. These primary goals have underpinned our annual pricing proposals over the past five years and are consistent with the IPART Pricing Principles specified in Annexure 12 of the Final Determination

Broadly, EnergyAustralia has adopted the following medium term pricing goals:

- achieve economic efficiency by allocating full costs to the customers that incur them (allocative efficiency);
- strive for continuous productivity improvements, innovations and efficient use of resources (dynamic efficiency);
- recover adequate revenue, subject to regulatory constraints, to sustain the network business, provide for future investment and maximise shareholder value;
- encourage economic behaviour by consumers through cost-reflective pricing and the use of price signals;
- ensure stakeholders (customers, Government, IPART) are satisfied to the greatest extent possible and can understand how network prices are derived;
- facilitate demand management, by using price signals to constrain demand where this is justified for environmental and cost-related reasons.

In regard to the revenue sufficiency objective, demand forecasts are now a crucial input to the new WAPC form of regulation, placing regulated network businesses to a certain extent at the whim of the weather to deliver a "normalised" outcome and thus ensure financial capital maintenance is realised.

The pricing goals, in combination with the type of metering at customers' premises, give rise to the structure of the individual network tariff components, which include:

- fixed charges, necessary to ensure revenue sufficiency and recover costs not related to usage;
- energy usage rates, set to recover long-run marginal costs where possible and send time-of-use pricing signals to the relevant customers;
- inclining block rates, new in 2004-05 and designed to reflect the increasing incremental costs associated with high levels of electricity consumption; and

- demand and capacity charges, based on maximum consumption in a half-hour period and designed to target a customer's contribution to capacity augmentation (peak demand drives enhancement of the network and incremental network costs).

4. Specific Pricing Strategies

In order to achieve the overall pricing goals, EnergyAustralia will be implementing specific pricing strategies for 2004-05. These strategies draw heavily from EnergyAustralia's medium-term pricing strategies articulated in the Price and Service Report, and are summarised as follows:

- improving cost allocation by identifying the true costs of providing network services to each customer or group of customers;
- improving economic signals to match the various cost components of the network, with particular emphasis on peak period consumption;
- providing transparency in price setting, ensuring customers understand how their network charges were derived;
- ensuring prices are equitable by ensuring cross subsidies do not exist, with all prices falling between their marginal and stand-alone cost;
- keeping prices relatively stable, by avoiding large upward price shocks, phasing in large price hikes where necessary (thus ensuring prices are socially and politically feasible).
- passing through TUoS charges in a cost reflective manner; and
- ensuring compliance with the WAPC, individual network price limits and restrictions on fixed residential charges.

All of these objectives are consistent with the cost reflective options presented by EnergyAustralia to IPART in submissions to the Final Determination.

EnergyAustralia utilises its Cost of Supply Model to determine cost reflectivity for large individual customers and groups of tariff customers. This model, which is updated annually, serves as a guide to the direction of price movements of individual tariff components. However, conflicting pricing objectives, such as the need to guard customers from substantial price shocks, often constrain prices from being set at the level recommended by the Cost of Supply Model in a given year.

5. Implementing Network Pricing Strategies in 2004-05

This section outlines the movement in various tariff components for broad tariff categories and customer groups, pursuant to the overarching pricing goals and objectives aforementioned. A summary of 2004-05 NUoS tariffs and price changes (as listed in the IPART Compliance Sheet) is provided in Appendix 1.

5.1 Transmission network prices (TUoS)

TransGrid acts as the co-ordinating Transmission Network Service Provider in NSW and calculates location specific transmission prices for both TransGrid and EnergyAustralia networks in accordance with the provisions of the National Electricity Code (the Code). EnergyAustralia provided its system and loading data and the revenue for both organisations was derived from the ACCC's draft transmission network determinations. In TransGrid's case, the 2004-05 revenue has been offset by a significant return of over recovered revenue and settlement surplus refunds.

It is proposed to retain the same ToU energy price structure as in earlier years, for the prices at EnergyAustralia Transmission Connection Points. Most TransGrid connection points have a price structure of a ToU energy charge and a kW Demand component.

The TUoS cost allocation is directly reflected in the prices of CRNP customers and these prices are also affected by individual consumption patterns and any network configuration changes. A complication in 2004-05 is that TransGrid has reviewed the assignment of some substation assets at Pymont and Bunnerong, producing price increases for the CRNP customers connected at those locations.

The table below shows a comparison of total expected TuoS revenue received by EnergyAustralia and total Transmission Related Payments. Transmission Related Payments are derived from the ACCC's draft determinations.

TUoS Revenue and Charges		2004-05
Revenue from Transmission Cost Recovery(TCR) Tariffs		201,790
MINUS	Total transmission related payments	203,648
Transmission charges to be paid to TNSPs		193,889
Expected avoided TUoS payments		535
Inter-distributor payments expected to be paid		9,224
EQUALS Transmission related payments under-recovery		(1,858)

Based on 2004-05 estimated consumption, it is estimated that EnergyAustralia will recover \$201.8 million in TUoS revenue. This will result in a slight under-recovery of total Transmission Related Payments in 2004-05 of \$1.8M against the target revenue of \$203.7 million.

5.2 Distribution Network Prices (DUoS)

EnergyAustralia's Distribution Use of System (DuoS) Price List for 2004/5 is available on our website by referencing www.energy.com.au/network_prices. A comprehensive explanation of EnergyAustralia's distribution pricing policies can be found in our *ES7 – Application of Network Use of System Charges* publication available from the same source.

Average Price Change in 2004-05

In its 2004 Final Determination, IPART has determined an average CPI + 7.0 (ie.9.8%) increase in averaged DUoS prices in 2004-05¹. However, based on the pricing objectives of improving cost reflectivity and shielding individual customers from substantial price rises, this price increase has not been uniformly applied.

New Inclining block structure for domestic and business tariffs in 2004-05

As foreshadowed in previous submissions to the 2004 determination process, an inclining two-block tariff structure (with threshold levels which align with the current EnergyAustralia retail tariff block structure) is proposed for the existing flat rate energy usage component of the current Domestic and LV Business Non-ToU Network tariffs.

Inclining block tariff components are already widely used throughout Australia for both retail and distribution components. In addition to NSW, retailers in South Australia and Victoria use an inclining block structure, as do most distribution companies in South Australia and Victoria. Inclining block tariffs have generally been used to try and tame growing peak demand without making a costly investment in the universal roll out of Time-of-Use (ToU) meters.

¹ CPI for the average of four quarters to December was 2.8%.

The inclining block tariff will apply to all customers on regulated, flat price Network tariffs, regardless of retail or contractual arrangements, but will not apply to customers on a Time-of-Use (ToU) regulated tariff.

Analysis confirmed an inclining block tariff component to be the best low-cost option for making the standard regulated domestic and business tariffs more cost reflective. Despite not being targeted at summer consumption, the inclining block tariff can be effective in signalling the significant costs associated with air-conditioning load on the network, due to the difference in average customer size for customers with and without air-conditioning. A further advantage of this tariff structure is that it creates an incentive for larger customers to migrate to other more cost reflective prices such as time of use. It will therefore be a useful supplement to the Type 5 time of use ('smart') meter rollout.

For the Domestic tariff, block 2 applies when consumption exceeds 1,750kWh per quarterly billing period (7 MWh per annum). For the LV Business Non-ToU tariff, block 2 applies when consumption exceeds 2,500 kWh per quarterly billing period (10 MWh per annum).

The capital expenditure on the Network is driven by the peak demand in summer and winter. The top 10% of energy consumed during peak periods imposes over 25% of network costs. A 20% pricing differential between base and inclining blocks has been selected for the inclining block tariff as a sufficiently meaningful target number. This is consistent with the rates proposed in EnergyAustralia's pricing submissions to the 2004 determination process.

The energy rates for block 1 and 2 have been calculated to maintain the 20% block price differential and to ensure revenue neutrality with the current anytime energy rates, adjusted for the price increase allowed in the Final Determination (rates are then rounded to two decimal places). Consumption estimates for blocks 1 and 2 are estimated using audited 2002-03 consumption data, adjusted for tariff movements in 2004-05.

Domestic customers currently consuming less than the base block point (1,750kWh per quarter) are expected to be relatively better off, as are those customers able to manage their total consumption below this level. Likewise, business customers consuming less than the base block point (2,500 kWh) are expected to be relatively better off, as are those customers able to manage their total consumption below this level.

Network Access Charge for domestic and non-ToU business tariffs

Based on the Cost of Supply Model, the cost-reflective Network Access Charge (NAC – the fixed tariff component) for the Domestic tariff significantly exceeds the 2003-04 (current) NAC level.

Under the new WAPC regulatory arrangements, IPART has imposed a price limit of \$30 per annum on the fixed charge component of residential customer bills. However, even if the full \$30 per annum was to be recovered from domestic customers, this would still be insufficient to equate NAC charges with the cost-reflective rate.

An increase in the NAC charge also acts to partially offset consumption risk under the WAPC, as this revenue is essentially assured and unlinked to actual energy demand.

Despite these considerations, EnergyAustralia has not increased domestic NAC charges by the full \$30 per annum, for the following two reasons:

- The price increase for very small customers would be relatively large. The price change resulting from recovery of the full \$30 would amount to 58¢ per week or a percentage increase of 15-40% for very small consumption customers.
- An increase of this magnitude would not be able to be passed on to small retail customers because of IPART's proposed Retail side constraint, which affects retail tariffs higher than the target price.

The level of the NAC also affects the extent of the price rise for customers with larger consumption. It is proposed that as a compromise, the NAC for domestic customers be increased by 12% nominal (2.2% in real terms). For very small domestic customers, this change to the NAC amounts to less than 10¢ per week. For larger customers, the network price increase would then be limited to 20%. Significantly, 83% of customers would receive a network price increase less than the average 9.8%.

In a similar vein, the non-ToU business tariff would also face unpalatable NAC price rises in order to reach the calculated cost-reflective rate. It is proposed to increase the NAC of this tariff by a similar percentage as that outlined for domestic customers.

Summary of pricing proposal for domestic and non ToU business customers

The following table sets out the price changes for domestic and single rate business customers resulting from the proposed introduction of the inclining block and increased NAC.

	NAC	Block 1 ¢/kWh	Block 2 ¢/kWh	Step kWh/quarter
Domestic FY04	\$ 0.117	3.980		
Domestic FY05	\$ 0.131	4.190	5.030	1,750
Business non ToU FY04	\$ 0.349	3.980		
Business non ToU FY05	\$ 0.391	3.840	4.610	2,500

The percentage price changes for domestic and non-ToU business inclining block tariffs are illustrated below.

It may be seen that the differing size profiles and block step between domestic and business non-ToU customers causes different pricing outcomes. The minimum percentage price increase occurs at the point of the block step.

The outcome of the proposed changes is summarised in the table below.

Consumption kWh p.a.	Domestic annual network bill				Business non ToU annual network bill		
	FY04	FY05	Diff. p.a.	per week	FY04	FY05	Diff. p.a.
1,000	\$ 82.62	\$ 89.72	\$ 7.09	\$ 0.14	\$ 167.53	\$ 181.12	\$ 13.58
2,500	\$ 142.32	\$ 152.57	\$ 10.24	\$ 0.20	\$ 227.23	\$ 238.72	\$ 11.48
5,000	\$ 241.82	\$ 257.32	\$ 15.49	\$ 0.30	\$ 326.73	\$ 334.72	\$ 7.98
7,000	\$ 321.42	\$ 341.12	\$ 19.69	\$ 0.38	\$ 406.33	\$ 411.52	\$ 5.18
10,000	\$ 440.82	\$ 492.02	\$ 51.19	\$ 0.98	\$ 525.73	\$ 526.72	\$ 0.98
15,000	\$ 639.82	\$ 743.52	\$ 103.69	\$ 1.99	\$ 724.73	\$ 757.22	\$ 32.48
25,000	\$ 1,037.82	\$ 1,246.52	\$ 208.69	\$ 4.01	\$ 1,122.73	\$ 1,218.22	\$ 95.48
40,000					\$ 1,719.73	\$ 1,909.72	\$ 189.98
160,000					\$ 6,495.73	\$ 7,441.72	\$ 945.98

The impact on domestic customers up to the average size of 5,700 MWh would be about 33¢ per week.

Off Peak tariffs

Currently, EnergyAustralia Retail does not offer Off Peak 2 for new connections or to regulated customers wishing to change from Off Peak 1. It is proposed to decrease the network rate for Off Peak 2 by 5%, to make it more attractive for all retailers. The rate for Off Peak 1 has been retained at the same nominal price, providing a differential between this tariff and the off peak rate of ToU tariffs to better reflect its value to the network in enabling the deferral of capital expenditure.

Business ToU tariffs

To improve the alignment of network revenue from business tariffs and the capital expenditure needed to fund network augmentation, it is proposed that:

- the NAC would be held constant in nominal terms; and
- peak energy, capacity and demand charges would all be raised by 20%, offset by relative reduction of the off-peak and shoulder rates in nominal terms.

This is necessary to provide price signals to consumers, which match as closely as possible the actual costs incurred by the network in providing their services. Increasingly, it is the peak demand period that drives network expenditure.

This rebalancing was tested on a large sample of Business ToU customers and the maximum price increase for any customer in FY05 was found to be less than 12%, as shown in the following diagram.

In addition, all remaining customers on the obsolete HV Business ToU tariff have been transferred to the HV kVA Demand ToU (System) tariff.

Increasing the number of customers on ToU pricing

It is proposed that the existing limited roll out of smart (Type 5 capable) meters will be increased significantly in 2004-05, predominately targeting business customers with consumption of 40 – 160 MWh per annum. As Type 5 capable meters are installed throughout the year, these business customers will progressively be moved from their existing anytime energy charges to a ToU price that includes a capacity charge from 1 July 2004.

The ToU rollout will involve:

- A transfer of business customers from LV Business Non-ToU, LV Business ToU (System) and LV Business ToU (Substation) to the LV kW Capacity ToU (System) tariff; and
- A transfer of Domestic customers to the LV Energy40 ToU (System) tariff.

In addition, following verification of the metering and billing processes, it is intended that ToU tariffs will be introduced for all new and upgraded multi phase connections to the network, expected to take place from 1 January 2005.

CRNP customers

The individually calculated prices of large customers are confidential to the customers concerned. What follows is a general discussion of the price movements and their treatment.

As noted above, TransGrid's TUoS calculation has resulted in price increases for large customers at Bunnerong and Pyrmont (in the range of 6.5%-21%). The intent of the Code is that TUoS prices should be directly reflected in customer prices in a cost reflective manner. Thus, it is proposed to pass these increases through in full. EnergyAustralia is required by Clause 6.18A of the Code to provide such customers upon request with unbundled TUoS and DUoS charges and details of the method of TUoS allocation.

Significant movement in the DUoS component of some individual cost reflective prices has also taken place, mainly due to consumption pattern and network configuration changes. Any large changes in the cost reflective DUoS amounts were subjected to transition, with a maximum price increase of 10% in FY05.

In 2004-05, a new CRNP customer, Bengala Mine, has been established. This customer has been transferred from the ST kVA Demand ToU tariff.

5.3 Miscellaneous and Monopoly Revenue

An explanation of Miscellaneous and Monopoly charges and their application is provided in EnergyAustralia's *ES5 – Miscellaneous and Monopoly Service Charges* publication available from our website by referencing www.energy.com.au/network_prices.

Miscellaneous services are non-routine services such as special meter reading, disconnection and re-connection services. Monopoly services are services related to extensions, augmentations or connections to the network. IPART has determined the revised price of these services in its 2004 Determination. It should be noted that a number of miscellaneous and monopoly fees were not actually collected by EnergyAustralia Network in 2003-04.

Appendix 2 provides a list of miscellaneous and monopoly charges for 2004-05.

6. Service Overview and Peak Demand and Consumption Forecasts

EnergyAustralia Network's aspirations for quality of supply and service reliability standards are set out in our *ES2 Electricity Supply Standards* publication available from our website by referencing www.energy.com.au/network_prices. Please refer to this document for details relating to expected service levels for 2004-05.

In broad terms, EnergyAustralia intends to spend \$323.1M (nominal) in overall system CAPEX on the distribution network over 2004-05 to maintain reliability at current standards, assuming the consumption levels indicated in the following table.

Major Customer Class	Unit	Consumption
Residential Sales	GWh	9,758
Non-Residential Sales	GWh	16,815
Major Industrial Customers	GWh	2,804
Total Sales	GWh	29,377
Total Maximum Demand	MW	5,317

As part of this CAPEX program, EnergyAustralia will be spending \$11.5 (nominal) on specific reliability projects targeting improvements for customers with excessive levels of interruptions. This expenditure will cover many projects at a local level from conductor covering, installation of more smart devices which isolate faulted parts of the network, to low voltage conductor upgrades.

Appendix 1: EnergyAustralia 2004-05 Tariffs and Price Changes²

	DLF	NAC ¢/day	Energy				Demand			Capacity			Price Change
			Anytime	Peak	Shoulder	Off Peak	Peak	Shoulder	Off Peak	Peak	Shoulder	Off Peak	
ST kVA Dem ToU	1.0158	483.5		1.46	0.90	0.43	0.69	0.28	0.07	0.59	0.25	0.06	9.7%

LV Business ToU (Substation)	1.0339	111.1		8.38	4.28	1.67							9.8%
LV Energy40 ToU substation	1.0339	17.4		8.71	2.09	0.56							6.3%
LV kVA Dem ToU (System)	1.0579	160.5		2.57	1.50	0.59	1.44	0.98	0.33	1.28	0.81	0.26	9.7%
LV kW cap ToU (System)	1.0579	140.4		4.37	2.73	1.25				1.41	0.59	0.20	9.7%
LV Business ToU (System)	1.0579	157.8		8.37	4.27	1.67							9.5%
LV Energy40 ToU system	1.0585	17.4		9.76	1.97	0.54							9.5%
Domestic ToU (obsolete)	1.0585	17.4		5.57	5.23	0.55							1.5%
Controlled Load 1	1.0585	1.1	0.35										-0.1%
Controlled Load 2	1.0585	1.1	1.85										-4.9%
Interruptible Load	1.0585	16.6		6.79	1.62	0.38							9.8%
Constant unmetered	1.0579	0.0	3.60										9.8%
EnergyLight	1.0840	0.0	2.96										9.6%
Public lighting	1.0840	0.0	2.96										9.6%
			Block 1	Block 2									
LV Business non-ToU	1.0579	39.1	3.84	4.61									9.8%
Domestic	1.0585	13.1	4.19	5.03									9.8%

² Based on price limits outlined in the IPART 2004 Final Determination, price changes must be less than 9.8%. Price changes are based on overall tariff revenue for 2004-05 and 2003-04, using adjusted 2002-03 consumption data.

Appendix 2: EnergyAustralia Miscellaneous and Monopoly Fees, 2004-05

Schedule of Miscellaneous Charges from 1 July 2004

(Prices are inclusive of GST)

Miscellaneous Service	\$
Special meter reading	\$38.50
Meter test	\$63.80
Supply of conveyancing information - desk inquiry	\$31.90
Supply of conveyancing information - field visit	\$63.80
Off-peak conversion	\$51.70
Disconnection visit (acceptable payment received)	\$38.50
Disconnection at meter box	\$77.00
Disconnection at pole top/pillar box	\$128.70
Rectification of illegal connection	\$192.50
Reconnection outside business hours	\$82.50

Schedule of Monopoly Fees from 1 July 2004

(Prices are inclusive of GST)

Monopoly Service	Underground urban residential subdivision (vacant lots)				Rural Overhead Subdivisions and Rural Extensions				Underground Commercial and Industrial or Rural Subdivisions (vacant lots - no development)				Commercial and Industrial Developments	Asset Relocation Or Street Lighting
Design Information (Minimum 1 Hr)	Up to 5 lots	\$138.60			\$69.30 per hour				\$69.30 per hour				\$69.30 per hour	\$69.30 or \$83.60 per hour (See Note 5)
	6 to 10 lots	\$207.90												
	11 - 40 lots	\$346.50												
	Over 40 lots	\$415.80												
Design Certification (Minimum 1 Hr)	Up to 5 lots	\$69.30			1 - 5 poles	\$69.30			Up to 10 lots	\$138.60			\$83.60 per hour	\$69.30 or \$83.60 per hour (See Note 5)
	6 to 10 lots	\$138.60			6 -10 poles	\$138.60			11 - 40 lots	\$207.90				
	11 - 40 lots	\$207.90			11 or more poles	\$207.90			Over 40 lots	\$415.80				
	Over 40 lots	\$277.20												
Design Rechecking (Minimum 1 Hr)	\$69.30 per hour				\$69.30 per hour				\$69.30 per hour				\$83.60 per hour	\$69.30 or \$83.60 per hour (See Note 5)
Inspection Fee (Minimum 2 Hrs @ \$69.30)	Grade:	A	B	C	Grade:	A	B	C	Grade:	A	B	C	\$69.30 or \$83.60 per hour (see Note 1)	\$69.30 or \$83.60 per hour (see Note 1)
