

Alternative Control Services - Changes for Power of Choice

The Power of Choice rule change will take effect in Queensland on 1 December 2017, opening the provision of metering services to competition. This change will have an impact on various Alternative Control Services. In relation to **quoted services**, any metering component no longer provided as part of the service will automatically be excluded from the quote and subsequent pricing. In relation to **price capped services**, the changes are summarised in the below tables.

Rate Adjustments	Proposed Changes
Customer request a temporary connection for short term supply (includes metered and unmetered) - Simple	Initial charge included the provision of a metering unit. As at 1 December 2017 the material cost and a component of labour relating to the metering unit have been removed from the service assumptions.
Supply Abolishment	Initial charge included the removal of the metering unit. As at 1 December 2017 the meter removal has been split out and included as a separate charge to allow for situations where the initial meter is not a regulated meter.
Underground Service Upgrade	This service previously comprised the upgrade of the pillar and a meter upgrade which was performed by the same crew but charged as two components. As travel could only be charged once, it was included in the meter installation charge. With Energex no longer performing the meter upgrade as at 1 December 2017, the travel component still remains but is now combined with the pillar upgrade component.
Appointment negotiation and power isolation to allow third party to install contestable metering	This service was previous incorporated in the meter installation fee, thus represents the component of the fee that may be undertaken by Energex where it is not practicable for the Metering Provider/third party to undertake (ie multi-tenancy apartments blocks).

Alternative Control Services - Changes for Power of Choice

Duplicated Services	Proposed Changes
A visit to the customer's premises to advise on electrical supply matters, could be for various reasons.	To allow for charging of separate party i.e. customer vs metering co-ordinator
Attending loss of supply (customer at fault)	Where it is found that the Energex meter was at fault there is no charge to the customer as Energex as the default meter co-ordinator is responsible. However, where the meter has another metering co-ordinator then the alternative metering co-ordinator will be responsible and charged. Therefore the fee needs to be duplicated to allow for multiple party charging.
Energex attends a site at the customer's request and is unable to perform the job due to customer's fault / fault of a third party.	To allow for charging of separate party i.e. customer vs metering co-ordinator dependant on fault

Services to Cease	Proposed Changes
<i>Please note that there will be a transitional period where jobs raised prior to 1/12/2017 are performed post 1/12/2017</i>	• New Permanent Connection (meter installation). • Install Control Load. • Install Hot Water. • Installation of a new meter (not controlled load). • Customer requested meter exchange (eg for alternative metering configuration /consolidation of multiple meters for one meter).
